Initiatives, which Contribute to a Better Health Care System?

Elisabeth van der Gulik*

**Dutch Royal Academy of Medicine, Utrecht, Netherlands.*

Received February 26, 2018; Accepted March 05, 2018; Published November 27, 2018

Health Care Systems all over the world are subject to difficult times. Exploration of new ways of co-operation leads to new initiatives. Elisabeth van der Gulik, Hon DL, actively retired physician, out of practice, reports.

As a new Member of the Editorial Board I want to bring to the attention of the audience new initiatives, as shown in Europe, United States, but also extending all over the world. Those initiatives are a result of the fact that researchers, doctors and public organizations are aware of many problems which have to be solved before they appear unsolvable in future. They are aware of the incapacity towards the whole of challenges the actual science brings us, for which they need the support from outside [1].

An example of new initiatives is a new conglomeration of researchers in The Netherlands. These researchers have been assembled only on an invitation, after their selection on the capability to fulfil the purpose of the new organization, called "On code", which has to be seen as a new virtual cancer institute.

When this initiative will appear to be successful, a tight co-operation will have been established, in which different laboratories will be sharing different phases of investigations and different phases may become undertaken in different institutions [2]. Even the profit of new medical findings and medicine will be shared among the members of the new institute, for which have been made fixed conditions.

The process of commercializing will be part of the system, for which the appointment of several business developers will be an important contribution. These co-workers stay in touch with the researchers and reflect about the possibilities of commercializing of different fundamental findings.

Patients will benefit from such collaboration, by the rapid process of bringing new medical findings and medicine to the market.
