The global economic effect of the five driving chronic diseases — malignancy, diabetes, psychological instability, CVD and respiratory disease — could reach $47 trillion throughout the following 20 years, as indicated by an examination by the World Economic Forum (WEF). As per the WHO, 80% of the total people principally those of developing countries depend on plant-inferred medicines for social insurance. The indicated efficacies of seaweed inferred phytochemicals are demonstrating incredible potential in obesity, T2DM, metabolic syndrome, CVD, IBD, sexual dysfunction and a few cancers. Hence, WHO, UN-FAO, UNICEF and governments have indicated a developing enthusiasm for these offbeat nourishments with well-being advancing impacts. Edible marine macro-algae (seaweed) are of intrigue in view of their incentive in nutrition and medicine. Seaweeds contain a few bioactive substances like polysaccharides, proteins, lipids, polyphenols and pigments, all of which may have useful wellbeing properties. People devour seaweed as nourishment in different structures: crude as salad and vegetable, pickle with sauce or with vinegar, relish or improved jams and furthermore cooked for vegetable soup. By cultivating seaweed, coastal people are getting an alternative livelihood just as propelling their lives. In 2005, world seaweed generation totaled 14.7 million tons which has dramatically increased (30.4 million tons) in 2015. The present market worth is almost $6.5 billion and is anticipated to arrive at some $9 billion in the seaweed global market by 2024. Aquaculture is perceived as the most practical methods for seaweed generation and records for around 27.3 million tons (over 90%) of global seaweed creation per annum. Asian nations created 80% for world markets where China alone delivers half of the complete interest. The best six seaweed delivering nations are China, Indonesia, Philippines, Korea and Japan.

Keywords: Seaweeds, Cancer prevention, Hyperglycemia management, Microalgae, Neuroprotection, Alimentary disorders

Abbreviations: MiBP: Monoisobutyl Phthalate; MEP: Monoethyl Phthalate; ∑DEHP: The Molar Sum of MEHHP and MEOHP; MEHP: Mono(2-Ethylhexyl) Phthalate; MEOHP: Mono(2-Ethyl-5-Oxohexyl) Phthalate; WEF: World Economic Forum; IHDS: Ischemic Heart Diseases; UN-FAO: Food and Agriculture Organization of the United Nations; GEBT: Gastric Emptying Breath Test; LMICs: Low and Middle Income Countries; CLA: Conjugated Linoleic Acid; SOFA: State of Food and Agriculture; UCP-1: Uncoupling Protein-1; HbA1c: Hemoglobin A1c; ERK: Extracellular Signal-Regulated Kinases; IBD: Inflammatory Bowel Disease; ACE: Angiotensin Converting Enzyme; OA: Osteoarthritis; CYP1: Cytochrome P450 1; MAPK: Mitogen-Activated Protein Kinases; COX 2: Cyclooxygenase-2; PI3K/AktV: Phosphatidylinositol 3-Kinase/Protein Kinase B; NF-kB: Nuclear Factor Kappa-Light-Chain-Enhancer of Activated B Cells

INTRODUCTION

According to FAO of the UN, nearly 45% of the female workforce is working in agriculture. Seaweed farming is surely a step toward gender equality (Figure 1).
OBESITY, HYPERTENSION AND HYPERGLYCEMIA MANAGEMENT

According to the WHO, 2.3 billion adults are overweight and the prevalence is higher in females of childbearing age than males [1]. In the US, the economic burden of obesity is estimated to be about $100 billion annually [2]. Worldwide obesity causes 2.8 million deaths per year and 35.8 million disability-adjusted life-years, some 45% of diabetes, 25% of IHDs and up to 41% of certain cancers [3]. Four major bioactive compounds from seaweeds which have the potential as anti-obesity agents are fucoxanthin, alginates, fucoidans and phlorotannins [4]. Alginates are amongst the seaweed fibers that are well-known for their anti-obesity effects. They have been shown to inhibit pepsin, pancreatic lipase [5], reduced body weight, BMI and the blood glucose level [6], ameliorate fat accumulation, TG and TC [7] in experimental animals. Koo et al. [8] reported Fucoxanthin powder developed from microalga Phaeodactylum tricornutum (Bacillariophyta) plus CLA or Xanthigen improved lipid metabolism, reduced body weight gain and adipose tissue. Individually, fucoxanthin lowers glycated hemoglobin, especially in healthy subjects with a certain UCP1 genotype [9]. Mendez et al. [10] reported anti-obesogenic potential of seaweed dulse (Palmaria palmata) in high-fat fed mice. Seca et al. [11] suggested that small peptides from seaweed may possess bioactivity, for example, of relevance for BP regulation. Yang et al. [12] reported Fucoidan A2 from the brown seaweed Ascophyllum nodosum (Ochrophyta, Phaeophyceae) (Figure 3) lowers lipid by improving reverse cholesterol transport in mice. Sørensen et al. [13] reported improved HbA1C and lipid profile with Saccharina latissima (Ochrophyta, Phaeophyceae) or sugar kelp (Figure 4) in mice. Fucoidan taken twice daily for a period of 90 days did not markedly affect insulin resistance in obese, nondiabetic cohort [14], but attenuates obesity-induced severe oxidative damage [15], show anticoagulant activity [16], suppress fat accumulation [17], may improve obesity-induced OA [18], antioxidant and lipolytic activities [19]. Catarino et al. [20] reported Fucus vesiculosus (Ochrophyta, Phaeophyceae) (Figure 5) phlorotannin-rich extracts have significant effect on α-glucosidase, α-amylase and pancreatic lipase. Phlorotannins, farnesylacetones and other constituents from seaweeds — have also been described for their potential use in hypertension due to their reported vasodilator effects [21]. Sun et al. reported the hydrogen bond and Zn (II) interactions between the peptides of Marine Macroalga Ulva intestinalis (Chlorophyta) and ACE [22]. In similar studies, peptides from Sargassum siliculosum, Sargassum polycystum [23], Fucus spiralis (Ochrophyta, Phaeophyceae) [24], Palmaria palmata [25], Pyropia yezoensis (Rhodophyta), Undaria pinnatifida (Ochrophyta, Phaeophyceae), Ulva clathrate (formerly Enteromorpha clathratclathrate), Ulva rigida (Chlorophyta), Gracilariosis lemaniformis, Pyropia columbina (Rhodophyta), Ecklonia cava, Ecklonia stolonifera, Pelvetia canaliculata, Sargassum thunbergii (Ochrophyta, Phaeophyceae) [26], Pyropia yezoensis (formerly Porphyra yezoensis) [27], Fushitsunagia catenata (formerly Lomentaria catenata), Lithophyllum okamurae, Ahnfeltiopsis flabelliformis (Rhodophyta) [28] show potential ACE inhibitory activities. Besides the activation of Ag II, ACE plays a concomitant role in the regulation of
hypertension via the inactivation of an endothelium-dependent vasodilatory peptide, bradykinin [28,29]. Kammoun et al. reported hypolipidemic and cardioprotective effects of *Ulva lactuca* (Chlorophyta), which effectively counteracts cardiotoxic effects of hypercholesterolemic regime [30]. In several studies *Ulva* species showed hypotensive, hypoglycemic, hypolipemic and antiatherogenic properties [31-40]. Moreover, studies also support seaweed-induced effects of postprandial lipoproteinemia [41-43], postprandial hyperglycemia [44-55], lipid metabolism and atherosclerosis [56-70], reduced body weight [71-80], HbA1c [13,34,52,55,81-90], reduced BP/episodes of hypertension [11,26,28,46,49,53,66,80,91-102] and prevented obesity-induced oxidative damage [4,8,13,34,103-120]. Increased seaweed consumption may be linked to the lower incidence of metabolic syndrome in eastern Asia [28].

CANCER PREVENTION AND TUMOR CONTROL

In 2019, 1,762,450 new cancer cases and 606,880 cancer deaths are projected to occur in the United States [121]. Globally, cancer is responsible for at least 20% of all mortality [122], 18.1 million new cancer, 9.5 million death in 2018 [123,124], the 5 year prevalence of 43.8 million [125], is predicted to rise by 61.4% to 27.5 million in 2040 [126]. Approximately 70% of deaths from cancer occur in LMICs [127]. Asia, Africa, and Latin America are collectively home to more than 50% of cancer patients; with more than half of global cancer-related mortalities occurring in Asia alone [128]. Cancer causes 46 billion in lost productivity in major emerging economies [129] and economic costs of tobacco-related cancers exceed USD 200 billion each year [130]. Compounds from natural sources with anti-proliferative activity represent an important and novel alternative to treat several types of cancer. Egregia menziesii (brown seaweed) (Figure 6) [131], Portiera hornemanni [132], Grateloupa elliptica (Rhodophyta) [133], Sargassum serratifolium [134], Chitosan alginates (polysaccharide from seaweeds) [135-143], xanthophylls (astaxanthin, fucoxanthin) and Phlorotannins (astaxanthin, fucoxanthin) and Phlorotannins (astaxanthin, fucoxanthin) and Phlorotannins (former Phloroglucinol) obtained from the microalgae [144-155], are reported in brain tumor (glioblastoma) studies. Astaxanthin and fucoxanthin are major marine carotenoids. Major seaweed algae sources of astaxanthin mono- and diesters are the green microalgae (Hematococcus lacustris - formerly Haematococcus pluvialis (Figure 7), Chromochloris zofingiensis - formerly Chlorella zofingiensis, Chlorococcom) and red-pigmented fermenting yeast Phaffia rhodozyma [156,157]. Fucoxanthin is present in Chromophyta (Heterokontophyta or Ochrophyta), including brown seaweeds (Phaeophyceae) and diatoms (Bacillariophyta) [158]. Several 2019 reviews discuss use of fucoidans (sulfated polysaccharide mainly derived from brown seaweed) in lung cancer management. Brown algae like Fucus vesiculosus, Turbinaria conoides, Saccharina japonica (formerly Laminaria japonica) (Figure 8) are reported in inhibition of tumor migration and invasion, apoptosis induction, and inhibition of lung cancer cell progression respectively [159]. Fucus distichus ssp. evanescens (formerly Fucus evanescens), Sargassum sp. (Figure 9) and Saccharina japonica were reported to inhibit proliferation and metastasis and induce apoptosis In vitro [160]. Undaria pinnatifida acted on ERK1/2 MAPK and p38, PI3K/Akt signaling; F. distichus ssp. evanescens (formerly F. evanescens) increased metastatic activity of cyclophosphamide and showed cytolytic activity of natural killer cells in 2 different studies and F. vesiculosus decreased NF-κB in LLC [161]. U. pinnatifida was found to show average antitumor and superior efficacy against LLC in the review of Misra et al. [162]. Sponge alkaloids from Aaptos showed potential in human lung adenocarcinoma A549, Fasaplysinopsis (Porifera) exerted an anti-proliferative and pro-apoptotic effect in lung cancer, and blue sponge Xestospongia showed apoptosis as well as stimulate anoikis in H460 lung cancer cells in review by Ercolano et al. [163]. The most common breast cancer type is the invasive ductal carcinoma accounting for 70-80% of all breast cancers diagnosed [164]. Brown seaweed fucoidan inhibited human breast cancer progression by upregulating microRNA (miR)-29c and downregulating miR-17-5p, thereby suppressing their target genes [165]. Lophocladia sp. (Lophocladiades), Fucus sp. (fucoidan), Sargassum muticum (polyphenol), Pyropia dentata (formerly Porphyra dentata) (sterol fraction), Cymopolia barbata (CYP1 inhibitors), Agarophyton tenistipitatum (formerly Gracilaria tenistipitata) Gracilaria tenistipitata was found to be effective in breast cancer studies [166]. High Urokinase-type plasminogen activator receptor (uPAR) expression predicts for more aggressive disease in several cancer types [167], dietary seaweed may help lowering breast cancer incidence by diminishing levels of uPAR [168]. The tropical edible red seaweed Kappaphycus alvarezi (formerly Eucheuma cottonii) (Figure 10) is rich in polyphenols that exhibited strong anticancer effect with enzyme modulating properties [169]. Jazara et al. [170] concluded that κ-carrageenan (sulfated galactans found in certain red seaweeds) could be a promising bioactive polymer, as it showed a remarkable inhibitory effect on MDA-MB-231 (triple negative breast cancer cell line) cell migration [171]. Several studies support polyphenols [172-176], flavonoids [177-186], fucoidan [159,160,166,187-195], lutein/zeaxanthin [196-200], other seaweed alkaloids, peptides, tannins and polysaccharides [132,164,201-210] in breast cancer management. The number of deaths from colorectal cancer in Japan continues to increase [211], it is the third most common diagnosis and second deadliest malignancy for both sexes combined [212]. It has been projected that there will be 140,250 new cases of colorectal cancer in 2018, with an estimated 50,630 people dying of this disease [213]. High intake of red and processed meat and alcohol have been shown to increase the risk of colorectal cancer [214]. U. pinnatifida [159,188,215-221], Saccharina latissima [222], Fucus vesiculosus [117,160,223,224], Sargassum hemiphyllum (Ochrophyta, Phaeophyceae) [155,225,226] have proven efficacy in this situation. Also, algae derived astaxanthin [150,227-232], fucoxanthin [233-237], lutein and zeaxanthin [238-241], polyphenols [242-246] have shown individual excellence.

NEUROPROTECTION IN STROKE, ALZHEIMER'S AND PARKINSONISM

Stroke is a leading cause for disability and morbidity associated with increased economic burden due to the need for treatment and post-stroke care. Acute ischemic stroke has enormous societal and financial costs due to rehabilitation, long-term care, and lost productivity. Between 2010 and 2030, stroke is expected to increase by more or less 60% in men and 40% in women [248]. Several studies reported neuroprotective role of astaxanthin and fucoxanthin [145,248-268] in stroke prevention, Alzheimer's, Parkinsonism and other neurodegenerative diseases. Barbalace et al. reported that marine algae inhibit pro-inflammatory enzymes such as COX-2 and iNOS, modulate MAPK pathways, and activate NK-kB [269]. Neorhodomela aculeata, Rhodomela confervoides (Rhodophyta) [26,270], Ecklonia cava (Figure 11) [271-275], Saccharina japonica (formerly Laminaria japonica) [276-281], Fucus vesiculosus [282-287], Sargassum spp. [288-295], Saccorhiza polyschides (Ochrophyta, Phaeophyceae) [283], Codium tomentosum [296], Ulva spp. (Chlorophyta), [256,267,293,297-300], Ecklonia maxima (Ochrophyta, Phaeophyceae) [256,301-303], Gracilaria spp. (Figure 12) [296,304-311], Gelidium pristoides (Rhodophyta),
[312,313], *Halimeda incrassata* (Chlorophyta) [314,315], *Alsidium triquetrum* (formerly *Bryothamniom triquetrum*) [316-318], *Chondrus crispus* (**Figure 13**) [319,320], *Hypnea valentiae* (Rhodophyta) (**Figure 14**) [298], *Ecklonia stolonifera* (Ochrophyta, Phaeophyceae) [321-323] were reported in several studies as neuro-protectives and suggested for use in neurodegenerative situations or are already in use in such conditions.

ALIMENTARY DISORDERS

In the USA, the sales of prescription GI therapeutic drugs were $25 billion, the 10th leading therapeutic class in terms of sales [324], with $135.9 billion spent for GI diseases in 2015 [325]. Urbanization, western diet, hygiene, and childhood immunological factors are associated with IBD in Asia [326]. On the other hand, 14% of the global population is affected by IBS and 30% by constipation [327,328]. Na-alginate has been used in the treatment of heartburn and GERD, although ESPGHAN/NASPGHAN Guidelines do not recommend its use in chronic GERD [329,330]. The \[^{13}C\]-Arthrospira platensis (formerly Spirulina platensis) (Cyanobacteria) GEBT is an easy to measure of gastric emptying with accuracy [331-333]. Saccharina japonica (formerly Laminaria japonica) (Ochrophyta, Phaeophyceae) (vomiting, hemorrhoids, IBD, probiotic synergist) [334,335], Kappaphycus alvarezi (formerly Eucheuma cottonii) (Rhodophyta) (IBD, hepatoprotective, anti-food allergy) [336-338], Caulerpa mexicana (Chlorophyta) (Figure 15) (Gastroprotective, IBD) [339-341], Hypnea musciformis (IBD) (Rhodophyta) [336,342], Fucus vesiculosus (gastroprotective, ulcerative colitis) [117], [343], Laminaria hyperborean, Laminaria digitatae (IBD) [344,345], Undaria pinnatifida (Ochrophyta, Phaeophyceae) (Figure 16) (improves gut health) are reported for use in gut health modulation [346]. In addition, seaweed polysaccharides are atypical in structure to terrestrial glycans and were found to resist gastric acidity, host digestive enzymes and GI absorption [347]. Maternal seaweed extract supplementation can reduce both the sow fecal Enterobacteriaceae populations at parturition and piglet E. coli populations at weaning [348]. Also, seaweeds are good source of prebiotics that improve intestinal microbiota and may exert positive effects on IBD and IBS [349,350].

THYROID FUNCTION

Seaweeds are a rich source of iodine and tyrosine [351], palatable and acceptable to consumers as a whole food or as a food ingredient, and effective as a source of iodine in an iodine-insufficient population [352]. In addition, daily diet should include thyroid boosting foods like those rich in iodine, the amino acid tyrosine, minerals like selenium, zinc, copper, iron, and various vitamins including, B2, B3, B6, C and E [353]. Edible seaweeds are rich in these vitamins and minerals [95]. Although high iodine intake is well tolerated by most healthy individuals, but in some people, it may precipitate hyperthyroidism, hypothyroidism, goiter, and/or thyroid autoimmunity [354]. Excess intake of iodine through seafood consumption is a suspected risk factor for thyroid cancer [355]. Also, some seaweed is contaminated with arsenic, mercury, cadmium and other heavy metals that have a positive association with thyroid hormones in adults [356-360].

ANALGESIC AND ANTI-INFLAMMATORY POTENTIAL

Neuropathic pain estimates are 60% among those with chronic pain. Mild-to-moderate pain may be relieved by non-drug techniques alone [128]. 1 g of brown seaweed extract (85% F. vesiculosus fucoidan) daily could reduce joint pain and stiffness by more than 50% [361,362]. Association between algae consumption and a lower incidence of chronic degenerative diseases is also reported for the Japanese [363]. Carrageenan has been widely used as a tool in the screening of novel anti-inflammatory drugs [364]. Among others, Pyropia vietnamensis (formerly Porphyra vietnamensis) [365,366], Kappahycus alvarezi (formerly Eucheuma cottonii) [367], Dichotomaria obtusata (Rhodophyta) (Figure 17) [368], Cystoseira sedoides, Cladostethus spongiosum, Padina pavonica (Figure 18) [369], Ecklonia cava (due to phlorotannins) (Ochrophyta, Phaeophyceae) [370-372], Caulerpa racemose (Chlorophyta) [373], Sarcodica ceylanica [374], Aactinotrichia fragilis (Rhodophyta) [375], Dictyota menstralitis (Ochrophyta, Phaeophyceae) (Figure 19) [376], Gracilaria cornea [377], Gracilaria birdiae [378], class Phaeophyceae, Rhodophyta and Chlorophyta [379], Caulerpa cupressoides [380,381], Ulva lactuca (Chlorophyta) (Figure 20) [382], Sargassum swartzii (formerly Sargassum wightii) and Halophila ovalis (Tracheophyta) [383], Grateloupia lanceolatae (Rhodophyta) [384], Sargassum fulvellum and Sargassum thunbergii (Tracheophyta) [385], Briaireum excavatum (Octocoral) [386], Caulerpa racemose (Chlorophyta) [387], Sargassum hemiphyllum (Ochrophyta, Phaeophyceae) [388], Laurencia obtusa (Rhodophyta) [389], Caulerpa kempfii [390], Caulerpa cupressoideis (Chlorophyta) [391] are reported for their analgesic and anti-inflammatory properties.

ANTIMICROBIAL PROPERTIES

Rising antimicrobial resistance is a threat to modern medicine. Infections with resistant organisms have higher morbidity and mortality, are costlier to treat and estimated to cause 10 million deaths annually by 2050 with global economic loss $100 trillion [392-394]. Lu et al. reported Saccharina japonica (formerly Laminaria japonica), Sargassum (Ochrophyta, Phaeophyceae), Gracilaria sp. and Pyropia dentata (formerly Porphyra dentata) (Rhodophyta) potentiated the activities of macrolides against E. coli [394]. Carragelose® (first marketed product from algae) has the ability to block viral attachment to the host cells and being effective against a broad spectrum of respiratory viruses [395]. Besednova et al. [396] reported that fucoidans, carrageenans, ulvans, lectins and polyphenols are biologically active compounds from seaweeds that target proteins or genes of the influenza virus and host components (Table 1).

Table 1. Antimicrobial activity of different solvent extracts from seaweeds [397].

Walsh et al. reported osteogenic potential of brown seaweeds *Laminaria digitata* and *Ascophyllum nodosum* [398]. Seaweed contains several compounds with antioxidant properties (phlorotannins, pigments, tocopherols, flavonoids, polyphenols and polysaccharides) [399]. Antioxidant properties of *Fucus vesiculosus* and *Ascophyllum nodosum* (due to phlorotannins) [399], *Turbinaria conoides* (2H-pyranoids) [400], *Ulva clathratae* (Chlorophyta) (phenolics and flavonoid contents) [401], *Bifurcaria bifurcate* (Figure 21) (diterpenes eleganolone and eleganonal) [402], *Cystoseira* spp. (phenolic constituents) [119], *Sargassum siliquastrum* (Ochrophyta, Phaeophyceae) (phenolic compounds, ascorbic acid) [403], *Ulva compressa* (Chlorophyta) (phenolic contents) [404], *Saccharina japonica* (polysaccharides) and *Sargassum horneri* (Ochrophyta, Phaeophyceae) (phenolic contents) [405,406], *Halophila ovalis* (Figure 22) and *Halophila beccarii* (Trachaeophyta) (flavonoids) [407,408], *Cystoseira sedoides* (Ochrophyta, Phaeophyceae) (mannuronic acid than guluronic acid) [369], [409,410], *Caulerpa peltata* (Chlorophyta), *Gelidiella acerosa* (Rhodophyta), *Padina gymnospora* and *Sargassum wightii* (phenols and flavonoids) [411], *Ecklonia cava* Kjellman (polyphenols) [412,413], *Undaria pinnatifida* (Ochrophyta, Phaeophyceae) (phlorotannins) [414] are well reported. Most other medicinal effects are mainly due to presence of these antioxidants. Mesripour et al. [415] reported antidepressant effects of *Sargassum plagyophylum*. *Ecklonia bicyclus* (formerly *Eisenia bicyclus*) *Saccharina japonica* (polysaccharides) and *Sargassum horneri* (Ochrophyta, Phaeophyceae) (phenolic contents) [405,406], *Halophila ovalis* (Figure 22) and *Halophila beccarii* (Trachaeophyta) (flavonoids) [407,408], *Cystoseira sedoides* (Ochrophyta, Phaeophyceae) (mannuronic acid than guluronic acid) [369], [409,410], *Caulerpa peltata* (Chlorophyta), *Gelidiella acerosa* (Rhodophyta), *Padina gymnospora* and *Sargassum wightii* (phenols and flavonoids) [411], *Ecklonia cava* Kjellman (polyphenols) [412,413], *Undaria pinnatifida* (Ochrophyta, Phaeophyceae) (phlorotannins) [414] are well reported. Most other medicinal effects are mainly due to presence of these antioxidants. Mesripour et al. [415] reported antidepressant effects of *Sargassum plagyophylum*. *Ecklonia bicyclus* (formerly *Eisenia bicyclus*) improved sexual and ejaculation function and sexual QoL [416]. Chronic pain is
often associated with sexual dysfunction, suggesting that pain can reduce libido [416]. However, red algae (especially sea moss/Gracilaria spp.), Hypnea musciformis (Vermifuge), Monostroma nitidum (formerly Porphyra crispa) are known to have aphrodisiac properties [417-419]. Thrombotic diseases are reported to contribute to 30% early deaths globally [420]. Ulva rigida [421], Udotea flabellum (Chlorophyta) (Figure 23) [422], ulvans and their oligosaccharides [380], Nemacystus decipiens, Undaria pinnatifida (Ochrophyta, Phaeophyceae) [423], Pyropia yezoensis (formerly Porphyra yezoensis) (Rhodophyta), Coscinoderma mathewsi (Porifera), Sargassum micranthum, Sargassum yezoense, Canistrocarpus cervicornis (Figure 24), Dictyota menstrualis, Ecklonia Kuromekurome, Ecklonia spp. (Ochrophyta, Phaeophyceae) [424] have shown anticoagulant and anti-thrombotic properties. He et al. reported that seaweed consumption may be a dietary predictor of elevated MEP, MiBP and ΣDEHP concentrations among pregnant women [425]. Urolithiasis affects approximately 10% of the world population and is strongly associated with calcium oxalate (CaOx) crystals. Gomes et al. reported anti-urolithic effect of green seaweed Caulerpa cupressoides [426]. Grateloupia elliptica has the potential to treat alopecia via inhibitory activity against Malassezia furfur (formerly Pityrosporum ovale) (Fungi, Basidiomycota) [427]. Strong fungus-inhibitory effects of Ochotodes secundiramea and Laurencia dendroidea (Rhodophyta) extracts were observed Banana and Papaya during storage [428]. Marine macroalgae are a promising source of diverse bioactive compounds with applications in the biocontrol of harmful cyanobacteria blooms [429].

CONCLUSION
Seaweeds are well-known for their exceptional capacity to accumulate essential minerals and trace elements needed for human nutrition, although their levels are commonly quite variable depending on their morphological features, environmental conditions, and geographic location. Food security, legislative measures to ensure monitoring and labeling of food products are needed. Being subject to environmental influences from their habitat, seaweeds also entail water-borne health risks such as organic pollutants, toxins, parasites, and heavy metals. Having in mind the serious environmental problems raised in coastal areas by urbanization and industrialization, the concentration of toxic elements in edible macroalgae is now a growing concern, mainly considering their increased consumption in a Western diet. Although many studies demonstrated their therapeutic value in various ailments, most of them have been performed on experimental animals. Proper labeling is necessary along with instructions of the content, source and use. Furthermore, controlled human intervention studies with health-related end points to elucidate therapeutic efficacy are required.
