

object in the sky. Refraction then plays a devastating role in finding any object at a straight line of sight. And when we combine changes in velocity with the change in direction there is literally no way to determine a real velocity of any object in the heavens, or its distance from us. Our calculations therefore are mere estimates. We then ought to conform ourselves to the reality in nature not only with waves but with the atom in its whole. And Hubble's law being quite in error.
