Received May 28, 2019; Accepted July 11, 2019; Published November 10, 2019

ABSTRACT

The principal purpose of this study was for the detailed and increasing relevance of war on medicine and surgery. The increasing relevance to the physics departments is also discussed. Both medicine and physics have been prestigious fields for some period. USA and Russia perhaps stand out as two entities with both medicine and space exploration as key areas of research and development, in addition to both countries appearing as often leaders in the global environment. The war climate globally is now stated as, in recent years and on-going, consisting of not only terrorist type warfare but also official world war type climate, after systematic analysis according to key criteria for the assessment of combat type. Furthermore, protection measures in a clinical setting are discussed such as measuring the weight of patients to ensure that during the period of uncertainty there is the intention displayed to be treating a macro-being and only targeting micro-organisms in terms of the use of antimicrobials. This is in addition to protection measures including checking mind related programs for abuse indicators and planning for measures to counter IP theft from the minds of individuals.

Keywords: Medicine, Surgery, Climate, Antimicrobial

INTRODUCTION

The current author is the researcher who has conceptualised (developed) the new antimicrobial pathway site attachment inhibition including new generation immunization (stem cell therapy based) [1].

The principal purpose of the current publication is to detail the increasing relevance of war to medicine and surgery. The increasing relevance to the physics departments is also discussed.

Both medicine and physics have been prestigious fields for some period. USA and Russia perhaps impress as two entities with both medicine and space exploration as key areas of research and development, in addition to both countries often appearing as leaders in the global environment.

The application of quantum physics (advanced physics) to medicine and surgery appears to be the future pathway for the profession as detailed by the current author in recent conference proceedings and publications [2-5]. The current author anticipates the increasing interest in physics in the medical faculties as perhaps changing physiology to the study of physics (with biology as a separate branch) as discussed particularly [2].

Physics has already been included in medicine and war faculties by way of nuclear and other research fields.

There appears to be a more in-depth involvement of physics, medicine and research type faculties in the future of war. Two important examples as an initial starting point are presented below. The reason for Minds as an example is to clearly show structure in that minds has always been considered the highest (most prestigious) level of study (research) in both medical and religious type faculties and also in war. Given Minds appears to be relevant in a war context to the above-mentioned faculties then the involvement of such faculties would seem worthy of the time and effort to establish the involvement given the prestigious level that is a strategic match with the prestigious type reputation of the faculties as detailed. The main aim of this study is to detail the increasing relevance of war on medicine and surgery, in addition to science departments particularly physics.

WAR

Example 1

Mind abuse programs: The following has been accepted for presentation at:

7th International Conference on General Surgery and Surgical Research Oct 23-24, 2019, Rome, Italy.

The war climate globally is now stated as, in recent years and on-going, consisting of not only terrorist type warfare but also official world war type climate, after systematic analysis according to key criteria for the assessment of combat type.

The key features present, according to generally accepted criteria, with regards to combat considered characteristic of world war type climate (categorisation):

1. Pledges to a leader positioning them in a defined manner.
2. Mind abuse type programs (mind coding and other).

*Mind abuse programs are carried out for numerous reasons (for example, to achieve a robotic following of the given leadership through brainwashing and related abuse).

USA, Britain and others have contained, although perhaps transiently, markers indicating such climate to have been present in such areas [1].

Given the markers, programs run during the years 2009-2016 (in addition to any other periods relevant) should be checked for mind abuse type programs. This would include

1. Brain Initiative program;
2. Mind mapping program, of which both are indexed on NLM, USA National Library of Medicine.

An Australian neurosurgeon was involved in the above with the given government members.

The programs may be of value but should be checked appropriately. In addition, consideration given to plans for the protocol to check other programs if appropriate.

In conclusion, the typical aspects of world war climate have been detailed along with the reasoning behind such regimes and groups containing such programs including mind abuse directed activities. Furthermore, it is advised that the programs including those detailed are checked to ensure they provide quality medical information for the intended use of the indexing services.

Example 2

Infectious disease in war type climate: There is currently a context of world war type climate in addition to crises internationally regarding infectious diseases. This has, as adjoined, the developing evidence of the awareness of infectious agents [1-13]. Although infectious agents may not

be aware in the same way as the macro-being, there are still sensitivities given the world war type climate as discussed in Example 1. This means that in addition to ensure antimicrobials only be used on micro-organisms there is also interest in research to ensure that micro-organism awareness isn't the same as macro being and war (or, other) type harshness occurring to such life forms. Respect for biology remains important.

Extending on the above, the awareness of infective agents should be taken seriously [3,13]:

1. There is consideration by respected universities regarding awareness of computers and the need to consider whether computers should be provided similar rights to that of human rights.
2. There is a merger occurring with the IT industry. Examples include three-dimensional printing of biology.
3. There is support for the opinion that infective agents may contain the awareness and this is detailed in previous publications, including their ability to distinguish between self and foreign (self-versus non-self-discrimination abilities).

On the other hand, the seriousness of the invasion of the person of the being by micro-organisms must be taken into account. In addition to whether there is awareness in the intent by the micro-organisms. The evidence in recent research by the current author is as follows:

At present, there is a demonstration of the following:

1. Microorganisms in the CNS performing voltage-gated ion channel communications, possibly demonstrating consciousness or at least a level of awareness.
2. An Axis that appears potentially to have been formed (at least in part) by microorganisms from the intestine(s) through to the pituitary gland (gut-brain axis) and notably the pituitary gland is an area around which used to be termed historically as the seat of the soul or mind. Based on the above, it could be viewed that these two signs (indications) demonstrate the attempted invasion of the mind of the person by another entity, for instance, that of the infective microorganisms. The implication of microorganisms in mental illness has been delineated previously by the current author (researcher) in reports listed below in the section titled References. It is worth considering whether a level of total (or, near total) control could be gained by the microorganisms, causing mental illness at the level of psychosis or insanity. The above is worth further investigating.

Future research will look at whether the micro-organisms could also be copying the neurological process and whether that is a form of IP theft [2,3,13].

Further to the above topics and reiterating that it is currently a period termed by some as world war type climate, it will

be interesting to perhaps further discuss in the future whether there is any relationship between war and medicine based on examples including USA has had roles in areas of war including that in Israel and such regions and also in regions containing infectious disease issues including Africa [3]. The views of the author are detailed somewhat again below but will be, after further research conducted, delineated in more depth in future publications.

Example 3

Modern IP crimes: Extension of mind abuse programs: The following has been accepted for presentation at:

31st International Conference on Mental Health October 24-25, 2019, Helsinki, Finland.

Introduction: It seems reasonable to suggest that, of the modern offences sciences is beginning to understand, IP theft offences represent an important category. Copying the intellectual property of others has always been an offence viewed as significant stemming back to more basic types surrounding plagiarism, copyright breaches and IP theft from computer type devices. Copying directly from the mind of individuals is not as well understood.

At present there appears to be mined abuse related programs as a focus and this may include copying IP directly from the mind and neurological processes of another [1-4]. Obviously electronic and IP crimes in terms of copying from the computer related devices of another is already understood to some extent. However, copying directly from the mind of another is not yet well understood and the following presentation describes this in addition to the possibility that the medical profession may be of use in terms of investigations surrounding such modern IP offences that may be occurring.

The reasoning of the presentation follows in the manner described:

1. That mind abuse programs may be occurring even in countries usually known for having a focus on proper following of rules [3,13-16].
2. Research shows an axis of interest directed at the mind of individuals in which copying of neurological processes may be occurring [13-16].
3. Formulation and summary of the findings

Future lectures will look at the progression of this topic. For instance, whether this can already commence being included in science type degrees. An example of an exam type question as follows:

Symptoms and disturbances of a person suffering attempts at modern IP theft (or, copying neurology) includes:

- A. Cortical spreading depression
- B. Invasion type hallucinations (e.g. Nazis or foreigners)

- C. Migraine and Aura
- D. All of the above
- E. Other

Concluding points of the presentation:

IP offences have been recognised as perhaps the most important of offences in modern society. Discussion of the above points highlights an Axis of interest directed toward the mind of individuals which includes copying and mimicking of mind (neurological) processes [3,13].

SUMMARY

This publication discusses recent research by the current author. There are both aspects of research in that some is able to be viewed as clinically relevant already such as the new generation immunization program and the need to check mind related programs (Example 1 above) that have occurred during the war type climate to ensure they provide the quality information that medical research funding agencies expect when used on the description of medical research. and some is in some ways futuristic but still able to be understood as perhaps coming into clinical relevance including the increasing consideration of the need to distinguish a difference (and whether there is a difference) between micro-organism awareness and that of a macro-being and why it should (if it should) still be viewed as appropriate for doctors to use antimicrobials. Furthermore, protection measures in a clinical setting such as measuring the weight of patients to ensure that during the period of uncertainty there is the intention displayed to be treating a macro-being and only targeting micro-organisms in terms of the use of antimicrobials until it is better ascertained as to the topic above regarding clarity as to whether there is continued appropriateness in prescribing antimicrobials with a material difference to that of war and military type attacks on enemies.

FUTURE RESEARCH

The current research detailed in previous proceedings that the offence of copying of neurology would be delineated. This report provides the upcoming conference presentation details and the summary of delineation for related content (copying IP directly from the mind of individuals).

Future research will be directed at the following:

Symptomatology of persons who may be suffering from attempts at IP theft. For instance, disturbances with perceptions including hallucinatory phenomena. The presentations will also cover suggestions regarding clinical relevance including documentation in medical and psychiatric exam note taking.

An example of an exam type question as follows:

Symptoms and disturbances of a person suffering attempts at modern IP theft (or, copying neurology) includes:

- A. Cortical spreading depression
- B. Invasion type hallucinations (E.g. Nazis or foreigners)
- C. Migraine and Aura
- D. All of the above
- E. Other

CONCLUSION

This publication (report) discusses the prestigious aspects of minds and physics. The report also discusses this in the context of war and details other aspects related to the current war climate including awareness of infectious disease type entities and immunization programs.

This publication provides discussion with regards to the recent research of the current author of which there is both: **(A)** Clinically relevant information in the immediate including the new generation immunization and the need to check mind related programs and planning for procedures and teachings relating to IP theft from the mind of individuals; **(B)** Research findings that are somewhat futuristic but still able to be viewed as perhaps of clinical interest.
